intel.log | Intelligence data matches

TYPE DESCRIPTION

Timestamp when data discovered

Which indicator types matched

Where data was seen

hit, this is uid for file

DESCRIPTION

Notice::Type of notice

Destination address

Underlying connection info > See conn.log

Sources which supplied data that resulted

If file was associated with this intelligence

Files 'described' to give more context

Timestamp for when notice occurred

File unique ID if notice related to a file

Mime type if notice related to a file

Files 'described' to give more contex

Human readable message for notice

Human readable sub-message

Source address, if no conn_id

Associated port, if no conn_id

Associated count or status code

Actions applied to this notice

Text description for peer that raised notice,

including name, host address and port

Underlying connection info > See conn.log

Mime type if intelligence hit is related to file

ZEEK® LOGS

FIELD	TYPE	DESCRIPTION
ts	time	Timestamp of first packet
uid	string	Unique identifier of connection
id	record conn_id	Connection's 4-tuple of endpoints
> id.orig_h	addr	IP address of system initiating connection
> id.orig_p	port	Port from which the connection is initiated
> id.resp_h	addr	IP address of system responding to connection request
> id.resp_p	port	Port on which connection response is sent
proto	enum	Transport layer protocol of connection
service	string	A comma-separated list of confirmed protocols in the connection
duration	interval	How long connection lasted
orig_bytes	count	Number of payload bytes originator sent
resp_bytes	count	Number of payload bytes responder sent
conn_state	string	Connection state (see conn.log > conn_state
local_orig	bool	Value=T if connection originated locally
local_resp	bool	Value=T if connection responded locally
missed_bytes	count	Number of bytes missed (packet loss)
history	string	Connection state history (see conn.log > history)

Number of packets originator sent

Number of originator IP bytes

Number of responder IP bytes

(via IP total length header field)

Link-layer address of originator

Link-layer address of responder

Outer VLAN for connection

If tunneled, connection UID value

For IP-based connections, this holds the

protocol identifier passed in the IP header

(via IP total length header field)

→ con	n_state
A sur	nmarized state for each connection
S0	Connection attempt seen, no reply
S1	Connection established, not terminated (0 byte counts)
SF	Normal establish & termination (>0 byte counts)
REJ	Connection attempt rejected
S2	Established, Orig attempts close, no reply from Resp

Established, Resp attempts close, no reply from Orig RSTO Established, Orig aborted (RST) -open")

	RSTR	Established, Resp aborted (RST)
	RSTOS0	Orig sent SYN then RST; no Resp SYN-ACK
	RSTRH	Resp sent SYN-ACK then RST; no Orig SYN
	SH	Orig sent SYN then FIN; no Resp SYN-ACK ("half-
	SHR	Resp sent SYN-ACK then FIN; no Orig SYN
	отн	No SYN, not closed. Midstream traffic. Partial connection.
	histo	ry
	Orig UF	PPERCASE, Resp lowercase
ш	S	A S YN without the ACK bit set
	H	A SYN-ACK (" h andshake")
	Α	A pure A CK
	D	Packet with payload (" d ata")
	F	Packet with F IN bit set
	R	Packet with R ST bit set
	С	Packet with a bad c hecksum
1		Inconsistent packets (e.g., SYN & RST)
	G	Content G ap
	Q	Multi-flag packet (SYN & FIN or SYN + RST)

FIELD	TYPE	DESCRIPTION
ts	time	Earliest time DHCP message observed
uids	table	Unique identifiers of DHCP connections
client_addr	addr	IP address of client
server_addr	addr	IP address of server handing out lease
client_port	port	Client port at time of server handing out IP
server_port	port	Server port at time of server handing out IP
mac	string	Client's hardware address
host_name	string	Name given by client in Hostname option 12
client_fqdn	string	FQDN given by client in Client FQDN option 81
domain	string	Domain given by server in option 15
requested_addr	addr	IP address requested by client
assigned_addr	addr	IP address assigned by server
lease_time	interval	IP address lease interval
client_message	string	Message with DHCP_DECLINE so client can tell server why address was rejected
server_message	string	Message with DHCP_NAK to let client know why request was rejected
msg_types	vector	DHCP message types seen by transaction
duration	interval	Duration of DHCP session
client_chaddr	string	Hardware address reported by the client
msg_orig	vector	Address originated from msg_types field
client_software	string	Software reported by client in vendor_class
server_software	string	Software reported by server in vendor_class
circuit_id	string	DHCP relay agents that terminate circuits
agent_remote_id	string	Globally unique ID added by relay agents to identify remote host end of circuit
subscriber_id	string	Value independent of physical network connection that provides customer DHCP configuration regardless of physical location

dns.log | DNS query/response

7		
FIELD	TYPE	DESCRIPTION
ts	time	Earliest timestamp of DNS protocol message
uid & id		Underlying connection info > See conn.log
proto	enum	Transport layer protocol of connection
trans_id	count	16-bit identifier assigned by program that generated DNS query
rtt	interval	Round trip time for query and response
query	string	Domain name subject of DNS query
qclass	count	QCLASS value specifying query class
qclass_name	string	Descriptive name query class
qtype	count	QTYPE value specifying query type
qtype_name	string	Descriptive name for query type
rcode	count	Response code value in DNS response
rcode_name	string	Descriptive name of response code value
AA	bool	Authoritative Answer bit: responding name server is authority for domain name
тс	bool	Truncation bit: message was truncated
RD	bool	Recursion Desired bit: client wants recursive service for query
RA	bool	Recursion Available bit: name server supports recursive queries
Z	count	Reserved field, zero in queries and responses unless using DNSSEC. Represents 3-bit Z field using spec from RFC 1035
answers	vector	Set of resource descriptions in query answer
TTLs	vector	Caching intervals of RRs in answers field
rejected	bool	DNS query was rejected by server
auth	table	Authoritative responses for query

Additional responses for query

dpd.log Dynamic protocol detection failures			
FIELD	TYPE	DESCRIPTION	
ts	time	Timestamp when protocol analysis failed	
uid & id		Underlying connection info > See conn.log	
proto	enum	Transport protocol for violation	
analyzer	string	Analyzer that generated violation	
failure_reason	string	Textual reason for analysis failure	
packet_segment	string	Payload chunk that most likely resulted in protocol violation	

files.log | File analysis results

FIELD	TYPE	DESCRIPTION
ts	time	Time when file first seen
fuid	string	Identifier associated with single file
uid & id		Underlying connection info > See conn.log
source	string	Identification of file data source
depth	count	Value to represent depth of file in relation to source
analyzers	table	Set of analysis types done during file analysis
mime_type	string	Mime type, as determined by Zeek's signatures
filename	string	Filename, if available from file source
duration	interval	Duration file was analyzed for
local_orig	bool	Indicates if data originated from local network
is_orig	bool	If file sent by connection originator or responder
seen_bytes	count	Number of bytes provided to file analysis engine
total_bytes	count	Total number of bytes that should comprise full file
missing_bytes	count	Number of bytes in file stream missed
overflow_bytes	count	Number of bytes in file stream not delivered to stream file analyzers
timedout	bool	If file analysis timed out at least once
parent_fuid	string	Container file ID was extracted from
md5	string	MD5 digest of file contents
sha1	string	SHA1 digest of file contents
sha256	string	SHA256 digest of file contents
extracted	string	Local filename of extracted file
extracted_cutoff	bool	Set to true if file being extracted was cut off so whole file was not logged
extracted_size	count	Number of bytes extracted to disk
entropy	double	Information density of file contents

ftp.log | FTP request/reply

1	·	
FIELD	TYPE	DESCRIPTION
ts	time	Timestamp when command sent
uid & id		Underlying connection info > See conn.log
user	string	Username for current FTP session
password	string	Password for current FTP session
command	string	Command given by client
arg	string	Argument for command, if given
mime_type	string	Sniffed mime type of file
file_size	count	Size of file
reply_code	count	Reply code from server in response to command
reply_msg	string	Reply message from server in response to command
data_channel	record FTP:: Expected Data Channel	Expected FTP data channel
fuid	ctring	Filo unique ID

http.log | HTTP request/reply

Re**t**ransmitted packet

Flipped connection

Connection analysis partial

Packet with zero window advertisement

FIELD	TYPE	DESCRIPTION
ts	time	Timestamp for when request happened
uid & id		Underlying connection info > See conn.log
trans_depth	count	Pipelined depth into connection
method	string	Verb used in HTTP request (GET, POST, etc.)
host	string	Value of HOST header
uri	string	URI used in request
referrer	string	Value of referer header
version	string	Value of version portion of request
user_agent	string	Value of User-Agent header from client
origin	string	Value of Origin header from client
request_body_len	count	Uncompressed data size from client
response_body _len	count	Uncompressed data size from server
status_code	count	Status code returned by server
status_msg	string	Status message returned by server
info_code	count	Last seen 1xx info reply code from server
info_msg	string	Last seen 1xx info reply message from server
tags	table	Indicators of various attributes discovered
username	string	Username if basic-auth performed for request
password	string	Password if basic-auth performed for request
proxied	table	All headers indicative of proxied request
orig_fuids	vector	Ordered vector of file unique IDs
orig_filenames	vector	Ordered vector of filenames from client
orig_mime_types	vector	Ordered vector of mime types
resp_fuids	vector	Ordered vector of file unique IDs
resp_filenames	vector	Ordered vector of filenames from server
resp_mime_types	vector	Ordered vector of mime types
client_header _names	vector	Vector of HTTP header names sent by client
server_header _names	vector	Vector of HTTP header names sent by server
cookie_vars	vector	Variable names extracted from all cookies
uri_vars	vector	Variable names from URI

	uri_vars	vector	Variable names from URI
	irc.log ı	IRC com	munication
	FIELD	TYPE	DESCRIPTION
	ts	time	Timestamp when command seen
	uid & id		Underlying connection info > See conn.log
	nick	string	Nickname given for connection
	user	string	Username given for connection
	command	string	Command given by client
	value	string	Value for command given by client
9	addl	string	Any additional data for command
	dcc_file_name	string	DCC filename requested
	dcc_file_size	count	DCC transfer size as indicated by sender
/e	dcc_mime_type	string	Sniffed mime type of file
	fuid	string	File unique ID
	1		_

Kerberos.log | Kerberos authentication

	JJ.10	5 Ref belos additentication
ts	time	Timestamp for when event happened
uid & id		Underlying connection info > See conn.log
request_type	string	Authentication Service (AS) or Ticket Granting Service (TGS)
client	string	Client
service	string	Service
success	bool	Request result
error_msg	string	Error message
from	time	Ticket valid from
till	time	Ticket valid until
cipher	string	Ticket encryption type
forwardable	bool	Forwardable ticket requested
renewable	bool	Renewable ticket requested
client_cert _subject	string	Subject of client certificate, if any
client_cert_fuid	string	File unique ID of client cert, if any
server_cert _subject	string	Subject of server certificate, if any
server_cert_fuid	string	File unique ID of server cert, if any
auth_ticket	string	Ticket hash authorizing request/transactio
new_ticket	string	Ticket hash returned by KDC

FIELD	TYPE	DESCRIPTION
ts	time	Timestamp for when event happened
uid & id		Underlying connection info > See conn
message_id	int	Numeric message ID
version	int	LDAP version number
opcode	string	Normalized message opcode
result	string	Result code
diagnostic_msg	string	Result diagnostic
object	string	Object identifier
argument	string	Message argument

Portable executable

FIELD	TYPE	DESCRIPTION
ts	time	Timestamp for when event happened
id	string	File id of this portable executable file
machine	string	Target machine file was compiled for
compile_ts	time	Time file was created
os	string	Required operating system
subsystem	string	Subsystem required to run this file
s_exe	bool	Is file an executable, or just an object file?
is_64bit	bool	ls file a 64-bit executable?
uses_aslr	bool	Does file support Address Space Layout Randomization?
uses_dep	bool	Does file support Data Execution Prevention
uses_code _integrity	bool	Does file enforce code integrity checks?
uses_seh	bool	Does file use structured exception handir
nas_import_table	bool	Does file have import table?
has_export_table	bool	Does file have export table?
has_cert_table	bool	Does file have attribute certificate table?
has_debug_data	bool	Does file have debug table?
section names	vector	Names of sections, in order

1. 1			
radius.log RADIUS authentication attempt			
FIELD	TYPE	DESCRIPTION	
ts	time	Timestamp for when event happened	
uid & id		Underlying connection info > See conn.log	
username	string	Username, if present	
mac	string	MAC address, if present	
framed_addr	addr	Address given to network access server, if present	
tunnel_client	string	Address (IPv4, IPv6, or FQDN) of initiator end of tunnel, if present	
connect_info	string	Connect info, if present	
reply_msg	string	Reply message from server challenge	
result	string	Successful or failed authentication	
ttl	interval	Duration between first request and either Access-Accept message or an error	

TYPE time	DESCRIPTION
time	T:
	Timestamp of first packet of SNMP session
	Underlying connection info > See conn.log
interval	Amount of time between first packet belonging to SNMP session and latest seen
string	Version of SNMP being used
string	Community string of first SNMP packet associated with session
count	Number of variable bindings in GetRequest GetNextRequest PDUs seen for session
count	Number of variable bindings in GetBulkRequest PDUs seen for session
count	Number of variable bindings in Get- Response/Response PDUs seen for session
count	Number of variable bindings in SetRequest PDUs seen for session
string	System description of SNMP responder endpoint
time	Time at which SNMP responder endpoint claims it's been up since
	interval string string count count count string

SOCKS.log | SOCKS proxy requests

		. ,
uid & id		Underlying connection info > See conn.log
version	count	Protocol version of SOCKS
user	string	Username used to request a login to proxy
password	string	Password used to request a login to proxy
status	string	Server status for attempt at using proxy
request	record SOCKS:: Address	Client requested SOCKS address
request_p	port	Client requested port
bound	record SOCKS:: Address	Server bound address
bound_p	port	Server bound port
softwa	ra la	T
		Software observed on network
FIELD	TYPE	DESCRIPTION
FIELD ts	TYPE time	DESCRIPTION Time at which software was detected
FIELD ts host	TYPE	DESCRIPTION
FIELD ts host host_p	TYPE time addr	DESCRIPTION Time at which software was detected IP address detected running the software
	TYPE time addr port	DESCRIPTION Time at which software was detected IP address detected running the software Port on which software is running Type of software detected

Full, unparsed version string found Root URL where software was discovered

Software:

Version

string

FIELD	TYPE	DESCRIPTION
ts	time	Time when SSH connection began
uid & id		Underlying connection info > See conn.lo
version	count	SSH major version (1 or 2)
auth_success	bool	Authentication result (T=success, F=failur unset=unknown)
auth_attempts	count	Number of authentication attempts observ
direction	enum	Direction of connection
client	string	Client's version string
server	string	Server's version string
cipher_alg	string	Encryption algorithm in use
mac_alg	string	Signing (MAC) algorithm in use
compression_alg	string	Compression algorithm in use
kex_alg	string	Key exchange algorithm in use
host_key_alg	string	Server host key's algorithm
host_key	string	Server's key fingerprint
remote_location	record geo_ location	Add geographic data related to remote h of connection

yara.log | YARA-based file analysis

,	_	
FIELD	TYPE	DESCRIPTION
ts	time	Timestamp for when event happened
uid & id		Underlying connection info > See conn.log
last_seen_ts	time	The last time the file was seen
fuid	string	Corresponding FUID identifier
file_name	string	File extracted to disk
source	string	Protocol of stream where observed
mime_type	string	Mime type
md5	string	An MD5 hash
sha1	string	A SHA1 hash
sha256	string	A SHA256 hash
archive_path	string	Location of archive
match_namespace	string	Namespace of YARA rule matched
match_rule	string	Name of matched YARA rule
match_tags	string	Tags included in matched YARA rule
match_meta	string	Meta included in matched YARA rule
file_matches	count	Total number of YARA matches for file

CORELIGHT COLLECTIONS

Corelight delivers a comprehensive suite of network security analytics that help organizations identify more than 75 adversarial TTPs across the MITRE ATT&CK® spectrum. These detections reveal known and unknown threats via hundreds of unique insights and alerts using machine learning, behavioral analysis, and signature-based approaches. The following Corelight Collections focus on our behavioral and statistical analyses and are organized by focus areas:

FIELD

uid & id

service

native_file_system string

Entity Collection

The Corelight Entity Collection gives security teams powerful identification capabilities around applications, devices, services, certs, hosts, and more to help them comprehensively understand and defend their environment.

PACKAGE	DESCRIPTION
Known Entities	Extract, aggregate, summarize and log individual network entities, including hosts, devices, names, users, and domains
Local Subnets	Identify local IPv4/v6 space subnets, both public and private
Application Identification	Identify over 150 applications, including BitTorrent, DropBox, Facebook, TeamViewer, WhatsApp, and many more

C2 Collection

Identify command and control activity with over 50 unique insights and detections.

PACKAGE	DESCRIPTION
HTTP C2	Detect known families of malware that conduct C2 communications over HTTP, such as Empire, Metasploit, and Cobalt Strike
DNS tunneling	Detect DNS tunneling behavior as well as the presence of specific tunneling tools such as lodine
ICMP tunneling	Detect ICMP tunneling behavior as well as the presence of specific tunneling tools such as ICMP Shell
Domain generation algorithms (DGAs)	Detect C2 traffic based on DNS activity from malware using domain generation algorithms
Meterpreter	Detect C2 activity from Metasploit's Meterpreter shell across HTTP and generic TCP/UDP traffic

Encrypted Traffic Collection

Combining observable elements like timestamps and packet sizes with known behavior of protocols, our encrypted traffic analytics offer a practical approach to visibility that lets you see and act on what matters.

	practical approach to visibility that lets you see and act on what matters.
PACKAGE	DESCRIPTION
Cert Hygiene	Identify risk indicators in your TLS traffic, such as newly minted certificates, expiring certificates, and the use of weak encryption keys
Encrypted DNS Server Detection	Detect DNS-over-HTTPS traffic
Encryption Detection	Track and log information related to unknown or unusual encryption methods
RDP Inference	Capture information and inferences about encrypted and unencrypted RDP connections through client, authentication, and behavioral inferences
SSH Inference	Generate inferences about SSH connections, such as keystrokes, file transfers, or authentication attempts
SSH Stepping Stones	Detect a series of intermediary hosts connected via SSH
VPN Insights	Identify and log VPN traffic, including over 300 unique protocols, and providers

COMMUNITY ID

When processing flow data from a variety of monitoring applications (such as Zeek and Suricata), it's often desirable to pivot quickly from one dataset to another. While the required flow tuple information is usually present in the datasets, the details of such "joins" can be tedious, particularly in corner cases. The "Community ID" spec for flow hashing standardizes the production of a string identifier representing a given network flow to reduce pivots to simple string comparisons. Learn more at github.com/corelight/community-id-spec.

DEFENDING THE WORLD'S **MOST SENSITIVE NETWORKS**

The Licensed Marks are being used pursuant to a license agreement with the Institute. Cheat sheets are based on Zeek 8 and are for reference only. For the most recent Zeek logs, visit zeek.org.
